

Project Name : RIVER
WATER QUALITY
MONITORING AND
CONTROL SYSTEM

Team ID
: PNT2022TMID42440

Date : 19 October

<div>SCENARIO</div> <div>Browsing, booking, attending, and rating a local city tour</div>	<div>PHASE</div>	<div>STEPS TO IMPLEMENT</div>	<div>OBJECTIVE OF THE PROJECT</div>	<div>CHALLENGES DURING IMPLEMENTATION</div>	<div>OPPORTUNITIES</div>		
<div>PHASE</div> <div>Steps to implement the project. Easy Representation to the user.</div>	<div>Testing the quality of the water</div>	<div>Measuring the PH, temperature and required parameters</div>	<div>Monitoring and controlling the water quality</div>	<div>Seperation of dirty and pure water and recyle them</div>	<div>Altering the authorities, if the water quality is not good</div>		
<div>STEPS</div> <div><div>How to implement</div><div>Methods for implementation</div><div>Description of the components</div></div>	<div>Depending on the quality of water, it may either be a source of life and good health or a source of diseases and deaths</div> <div>Increasing water pollution in oceans, lake, and river triggers worldwide demand more advanced methods in monitoring systems</div> <div>Remove the solid waste from water and remove the turbidity in the water.</div> <div>his Wireless Sensor Network (WSN) is suitable for monitoring physical and chemical water characteristics in remote areas</div> <div>The pH parameters are difficult to measure accurately as it deals with the very small amount of ionic concentration thus need a sensitive sensing device for its detection</div> <div>Separate the water into soluble and disoluable</div> <div>Its constitute varies from 0 to 14 pH</div> <div>Mathematically pH is referred as, $pH = -\log [H^+]$.</div> <div>Turbidity train sensor is victimised to measure the clarity of element or muddiness utter in the water</div> <div>Irrigate is visibly at levels above 80 NTU</div> <div>The normal temperature of the people is (25 -30)° C</div> <div>pH values also process the solubility of elements and compounds making them cyanogenetic</div>	<div>To measure water parameters such as pH, dissolved oxygen, turbidity, conductivity, etc.using available sensors at a remote place</div> <div>The system should be reliable and scalable</div> <div>To simulate and evaluate quality parameters for quality control</div> <div>The data visualization application runs on client devices such as Smart phones, laptops and desktops</div> <div>A rain garden is a constructed area which collects rainwater from roofs, pipes and driveways etc</div> <div>Adding a pinch of salt for each quart or liter of boiled water</div> <div>If the acquired value is above the threshold value comments will be displayed as 'BAD'.</div> <div>It continuously senses the values of pH, temp, turbidity</div> <div>If the acquired value is lower than the threshold value comments will be displayed as 'GOOD'</div> <div>To send SMS to an authorized person routinely</div> <div>when water quality detected does not match the preset standards, so that, necessary actions can be taken</div>	<div>To measure water parameters such as pH, dissolved oxygen, turbidity, conductivity, etc.using available sensors at a remote place</div> <div>The system should be reliable and scalable</div> <div>To simulate and evaluate quality parameters for quality control</div> <div>The data visualization application runs on client devices such as Smart phones, laptops and desktops</div> <div>A rain garden is a constructed area which collects rainwater from roofs, pipes and driveways etc</div> <div>Adding a pinch of salt for each quart or liter of boiled water</div> <div>If the acquired value is above the threshold value comments will be displayed as 'BAD'.</div> <div>It continuously senses the values of pH, temp, turbidity</div> <div>If the acquired value is lower than the threshold value comments will be displayed as 'GOOD'</div> <div>To send SMS to an authorized person routinely</div> <div>when water quality detected does not match the preset standards, so that, necessary actions can be taken</div>	<div>In the proposed architecture, each water reservoir will be attached with a sensor node equipped with a set of sensor probes capable of measuring the parameters like pH, turbidity etc</div> <div>The consequence of turbidity is a reduction in water clarity, aesthetically unpleasant, decreases the rate of photosynthesis, increases water temperature.</div> <div>Usually, its present use to perceive the temperature of the life, if we site the device wrong the conductor electrode and placed into the H₂O</div> <div>Improvement and restoration of soil quality and thus, raising productivity rates</div> <div>Ease and convenience of usage</div> <div>If sampling is the sole way that water quality is checked, there is unfortunately always the prospect of human error</div> <div>supply and securing of clean and sufficient drinking water for the population</div> <div>reducing the impact of natural hazards (especially in the context of climate change)</div> <div>provision and securing of access to sanitation</div> <div>enhance product quality and reduce risks.</div> <div>To treat the water to reduce or remove contamination that could be present to the extent necessary to meet the water quality targets</div> <div>To ensure safe drinking-water through good water supply practice</div> <div>Improve customer service, Make sure employees are trained in quality.</div> <div>primary goal of quality improvement is to improve outcomes</div> <div>For an indicator to be effective it must provide a true measure of a component of the ecosystem</div>	<div>If the river water qualities in correct level groundwater level increase.</div> <div>Animals and birds are drinking river water</div> <div>River water is essential for human being.</div> <div>In the PH level of the river water matches to the PH level oh the pure water then the water is good to use.</div> <div>pH, Conductivity, Salinity and Temperature can be measured/monitored using the principal of multi parameter electrode</div> <div>Amperometric membrane can monitor free chlorine (Cl₂ + HOCl + OCl⁻) or total chlorine (free chlorine + combined chlorine)</div> <div>the collection of sensor data, including low-quality raw data. This brings additional challenges when it comes to understanding and monitoring water quality.</div> <div>In many regions in the world, raw data sets related to water quality cannot be obtained directly, mainly due to various regulations and data protection laws</div> <div>Intelligence-enabled IoT offers a way to address problems such as these</div> <div>Every laboratory has a limit of the number of samples it can analyze in a particular period, say a day or a week</div> <div>[Description of a positive moment]</div> <div>[Description of a positive moment]</div> <div>Despite, good features and reliability cost of instruments for testing water quality may become a hindrance for Boards</div> <div>Many water testing laboratories face technical difficulties</div> <div>According to the guidelines given by the World Health Organization (WHO), water quality samples should be stored in low temperatures</div>	<div>If the river water quality is not good then the groundwater will be decrease.</div> <div>If the river water is polluted then animals and birds cannot able to drink water.</div> <div>Polluted water is not essential for human being</div> <div>Chemical waste products from industrial process or discharge into river</div> <div>pollution maker due to acid rain</div> <div>Thefting of sand from Riverside may cause the river to dry fast</div> <div>Because of throwing dust it will create some mess smell</div> <div>water pollution may cause disease</div> <div>This causes harm to organisms living in the river water.</div> <div>it will affect the ecosystem this water is harmful for drinking this causes harm to organisms living in the river water.</div> <div>To assemble data from various sensor nodes and send it to the base station by the wireless channel</div> <div>The environment around consists of five key elements e.g., soil, water, climate, natural vegetation, and landforms. Among these water is the utmost crucial element for human life.</div> <div>This causes come to organisms tiving in the river water</div> <div>Also increasing river water temperature affect the living organism</div> <div>In this research, we monitor the physical and chemical parameters of water bodies.</div> <div>To simulate and evaluate quality parameters for quality control.</div> <div>To send SMS to an authorized person routinely when water quality detected does not match the pretestandards, so that, actions be taken.</div> <div>Real-time monitoring of water quality by using IoT integrated system helps people to become conscious against using contaminated water as well as to stop polluting the water</div>	<div>Used in the agricultural for cultivation and other purposes</div> <div>We use the detector to easily identify our device</div> <div>Our device is miniature compared to other devices</div> <div>We Include sensor for detection of PH level of the water</div> <div>Here we used temperature sensor to detect the temperature of the water</div> <div>We need high precision components for quality testing.</div> <div>Belief Rule Based (BRB) system and is also compared with standard values.</div> <div>Water quality monitoring has gained more interest among researchers in this twenty-first century</div> <div>The main aim is to develop a system for continuous monitoring of river water quality at remote places using wireless sensor networks with low power consumption</div> <div>Chlorine dioxide tablets can kill germs, including Cryptosporidium, if you follow the manufacturer's instructions correctly</div> <div>Ultraviolet light (UV light) can be used to kill some germs.</div> <div>The sun's rays can improve the quality of water. This method may reduce some germs in the water</div> <div>It is used in agricultural held for testing the river water quality</div> <div>Used in the industrial purpose</div> <div>It help people to become conscious against using contaminated water as well as to stop polluting the water</div>
